

A 2006-30-129

Before describing the very interesting results of last winter's excavations allow me to say a few words about Abydos itself and to remind you of the reasons which induced us to spend the cruel winter in slogging through that spot, though at the beginning some people thought that the results would not be very encouraging.

Abydos, in Egyptian About was a city of Middle Egypt built on the border of the desert. Its site is now occupied by two villages, Abul al Madfuna and Beni Hassan. These villages are now at a distance of more than six miles from the ~~Nile~~ river, but it is quite possible that four thousand years ago the Nile was much nearer; for it is well known that the bed of the river has a strong tendency to displace itself towards the Part.

Abydos seems to have had a political importance like Thebes or Memphis. It was chiefly a religious city. The capital of the nome or province in which Abydos was situated, was This, g. Tenu the god of which was Anubis. But Abydos was the residence of a god venerated throughout the whole of Egypt, Osiris. Osiris is the most interesting god of the Egyptian mythology. He is the most human, and the only one who has a kind of moral character. Before him the deceased are said to appear to have their heart weighed in the balance. The ceremony takes place in hell in the Abydos of the Nether world. Osiris who has chance appearance is the president of the court and presides the sentence.

Abydos always had a sacred character. At the same time it is connected with the early times and even the foundation of the kingdom. According to a legend which is inspired in Greek authors, Moses the first historical king.

(2)

Left this the city just mentioned as the capital, at a short distance from Alydos went down the river course as the origin of the Delta and founded Memphis.

At Alydos itself or about one mile's distance in the valley near the foot of the mountain which lines the valley, is a mound called by the natives Hamm el Gazz, the mother of pots. This mound is of a red colour because of the numerous number of potsherds with which it is covered somewhat like the Testaccio at Rome. Here Mr. Americus and Prof. Flinders Petrie afterwards had found brick constructions to which the name of tombs has been given. I rather believe that they are structures devoted to the worship of the kings, like the temples of the West side of Heliopolis. There have been discovered a great number of objects of various kinds, among them vessels of jar bearing the names of the kings of the three preceding dynasties. Thus Alydos is a place interesting both because of the worship of Osiris and of the remains of the olden kings which have been discovered there.

By the border of the desert we found ruins of constructions of different epochs. The great attraction for travellers is a temple of the ~~XIX<sup>th</sup>~~ Dynasty raised by King Set I to Osiris. The greatest part of it has been destroyed by Mameluke, many years ago. The Greeks of the Service are now completing its reconstruction. It is dedicated to Osiris and is ornamented with sculptures which certainly are among the most beautiful found in Egypt. Set I & Ramses II enlarged it, but his work scarcely compares with that of his father.

The temple is of a special character. It is like the constructions raised to the memory of a deceased king, and where a worship was celebrated a little longer. It seems rather curious to speak of deities in reference to a god. But Osiris was a god who died. He was considered to be very

\* carkanae

\* wahmada

(3)

been killed by his enemy Set who cut his body to pieces and scattered the limbs between the various cities of Egypt. However the body of Osiris was reassembled by his son Horus. He has of several tombs of Osiris; the most famous was that of Abydos which was said to contain his head. It was the wish to find this tomb which induced us to excavate at Abydos. Previously the temple of Seti must have been connected with the tomb of the god, which perhaps explains its name, is doubt.

In 1908, Prof. Flinders Petrie began excavation behind the temple towards the desert, along the sacred enclosure the wall of the temenos. Prof. Petrie, or rather his assistant Miss Murray discovered then a passage leading to a hall covered with text of the Book of the Dead. At the end of the passage towards the South is a circular or concave also with text and figures from the book called the Aia Nekh, which is in the Netherworld. In the side wall of the hall is a door of which Miss Murray found the lintel and the doorposts covered with inscriptions from the B. of the D. Prof. Petrie considers this hall and chamber as being a building for the special worship of Osiris, and also as being Seto's wall. The side door would be the entrance for people coming from the temple of Seti.

From the first it appeared to me that this hypogeum was for Seto's wall and that the door discovered by Miss Murray was not the point of access but on the contrary the starting point to which a construction which existed ~~either~~ in the space between the hall and the temple, or perhaps some <sup>tower</sup> subterranean sanctuary under the temple of Seti.

Therefore in 1912 we were obliged to this doorway which had to be cleared again entirely. Behind it was a passage full of rubbish for the slate stone ceiling had disappeared. It was about 4x5 feet long. The

4

walls are covered with text of the Book of the Dead which are written in a curious way. They begin on the left side, at the end of the passage. The passage at first slopes gently, then it becomes horizontal again and it slopes at two wide side openings which we thought at first to be two separate chambers on the east side. Passing further on we came upon a big lintel 15 feet long. This lintel which is threefold is the top of a doorway built in a wall twelve feet thick. Beyond it we found two angles which might be doors, but the stones of vault in front of us, did not allow us to go farther forward. We turned to the right, where the mass of rubbish was not quite so high; we followed the top of the wall of the doorway, and at a distance of close 30 feet we met the sidewall of the construction. We cleared the upper part of that angle, and we recognized already that the wall consisted of two courses, the outer one of limestone, the inner one of enormous blocks of red material which Dr. Gunn told us was hard sandstone coming from the neighbourhood of Assuan. The masonry is extremely fine, and reminds one very strongly of the so-called temple of the Sphinx & my various British contemporaries write the pyramids.

- March 1912

That was the state of the work when we left in March 1912. We had cleared the passage, the cleared the top of the wall joining the enclosure on the south and so had dug to the bottom of what we thought to be the South chamber, to a depth of close 18 feet. On the North side of the lintel we had another 30 feet of rubbish to clear away, so we stopped for want of time.

Toward the temple at a short distance from the end of our excavation we incorporated by a most serious and really disheartening obstacle, an enormous mound raised by the excavations of Mariette, who, when he cleared the temple of Seti I many years ago, threw the rubbish as near

as possible.

Tons of rubble had been piled up there. He well know work without  
decency among their hounds, a long and expensive work for which absolutely  
no result was to be expected.

This was one of the reasons why it was thought better not to dig in the year  
(1913). In ~~attempting~~<sup>attempting</sup>, Alymer said, it was necessary to have a sufficient  
sum of money and also that Society's members should have been educated  
properly. This was done by the agents of the Society, whose acquaintance had been  
made with Sir Foster Myles. When arrived, the house had disappeared  
and between the sand the temple, there was only the natural soil.

The digging work on the hillside. Our party consisted of four men and two ladies.  
My three assistants were Prof. Whittlesey from Boston. Mr. Macmillan and  
Mr. Gilman. The two ladies were Mrs. Sherrill and Mrs. Gibson. On this  
occasions when I am describing what we have done last winter I feel bound  
to express to my assistants my sincere gratitude for the very efficient help which  
they rendered you me during the eleven weeks of the excavation. Of course  
the director rests the responsibility of the line to be followed, and of  
the method adopted. At the same time a great part of the success depends on  
the way this method is carried out, on the unity of views and of purpose  
between the workers, which may readily be disturbed by the interest interest  
of the work. Certainly this interest whilst director and assistants all felt  
keenly has been a powerful stimulus, and has materially contributed to  
the successful result which I hope the pleasure of describing to the  
members.

We began at once with a large number of workmen more than 400 the  
two kinds of whom were busy removing the basket. At the end of the work  
the number reached even to 639. It is the largest work which has ever  
been undertaken by the P. S. F.

• Beginning

We started from the doorway with the big cartels and we pushed forward towards the temple. An excursion on such large proportions has to be conducted with method so as to avoid damages which may be serious waste of money. The first thing to do is to trace the form of the building. On the North side which was less obscured in 1912 than the South un-scarred for the enclosure well, and we found that it was elliptical, symmetrical on both sides.

• North side

After our weeks work, this is a view of the North side. The South side was more obscured, but much more ruined than the North, - quarry - millstones.

Going forward according to the same method after three weeks digging we had cleared a construction of which I shall first show you the plan. The three walls. - enclosure well. - cells. - post recesses - middle platform, an island - pillars. - chamber of bins Peter rollers hole.

• Plan

General view. The three walls. Pillars.

" from the South. In Menaphtheum. Post recesses very well diminished.

The back wall. Pillars. - ~~Post recesses~~ -

Achthons. Block of 120 tons

Pillars. Broken or millstones

Pillar edge. water.

Cells. Knots for holding stones. Hole for door to masonry go.

The discovery of this construction which I consider half considering one of the oldest in Egypt raises a great number of questions which perhaps the excavation of next winter will help us to solve.

This very old building is neither a tomb nor a temple. It is a pyramidal construction. Is it likely that such a cyclopean building has been raised merely for irrigation water. Was there a spring in that place, or some communication with the Nile. It seems probable that these old Egyptians knew very well the laws of the river and the fall of the Nile. They knew also & of the existence of what is called now the subterranean Nile which flows under the desert and the cultivated lands and which <sup>the engineers</sup> they try to utilize for the irrigation of the country.

Why was this water stored and sheltered against evaporation by by those enormous vaults? Was it supposed to have a medicinal effect? Did people come to the tanks to have their health restored?

Or was this pool connected with the works of Osiris. Was the sacred boat towed by priests walking out narrow ledge? Or is it a copy of Osiris of a later date than the construction of the pool? It may take some time before these questions are answered. Meanwhile let us complete the excavation of this monument which at present is unique in Egypt, and certainly despite of its debilitated air of the most striking example of the architecture of the remote times.

Horus.
